

Hibernate 'til Spring
Benefits of Spring MVC, Hibernate and Struts for the
Development of a Web Application

Chris O'Brien

March 18, 2014

Abstract

Web development is one of the fastest growing areas in software development, with new tools being developed yearly.

Chapter 1

Introduction

1.1 General Introduction

This project concerns the development of a web application using a web framework in conjunction with a number of other tools. Throughout development, there is a particular cognisance towards the support of Non-Functional Requirements [NFRs] by both the web framework and the supporting tools throughout the development process.

1.1.1 General Introduction

The main goal of this project is to reflectively analyse a WAF [Web Application Framework], and architecture stack, in the creation of a website. This will be analysed in respect to both functional and non-functional requirements. Two key requirements are extensibility and maintenance. Extensibility refers to the ability of the framework to allow added functionality to the web application without having to modify the core workings of the application. Maintenance refers to the upkeep of the code, and facilitates the modification of the source code after the product is deployed. This may be to correct faults, improve attributes such as performance and security. The creative driver of the project is the development of a website to meet the requirements and needs of Monaleen Tennis Club, for both members of the club and of the committee. These needs will overlap as all committee representatives are all club members, but not all members are on the committee. From this, it was important to identify the precise requirements for each type of user. The main focus of this project was for the club to be able to perform their core functions through the website. This extended to the registration of members, a timetable for the courts, the creation and distribution of tournament schedules, the organisation and timetabling of training sessions, a method to contact all members and a news section to update and advise members of changes and upcoming events .

- Member Management
- Timetable Management
- Tournament Management

1.2 Objectives

1.3 Scope

1.4 Methodology

The methodology chosen as the foundation for this project is the Russo and Graham (1998) design methodology. It focuses on 9 iterative steps, each with feedback loops. The steps are outlined below

- Identification of the problem
- Analysis
- Design of the Application
- Resource Gathering
- Coding
- Testing
- Implementation
- Post Implementation Review and Maintainance

Other methodologies that were examined such as Balasubramanin and Bashian (1997), Siegel (1997), Iskawitz et al (1995) and Cranford-Teague (1998). The pros and cons of these methodologies were examined by Howcroft and Carroll (Howcroft and Carroll 2000), and after an examination of their findings, the Russo and Graham methodology best suited the nature and scale of this project. While the other methodologies are strong, they are geared towards large scale web development projects, or towards document-centred websites, and would not suit this project.(Howcroft and Carroll 2000) Using these as a guide, the following methodology was established.

- Identification of the problem
- Structured Literature Review

- Statement of the FYP Objectives
- Design of the Test Suite
- Development of the Prototype
 - Analysis
 - Design of the Application
 - Resource Gathering
 - Design Review
 - Coding
 - Testing
 - Implementation
 - Post Implementation Review and Maintenance
- Empirical Study
- Critical Evaluation of the Results

1.5 Overview of Report

1.6 Motivation

The motivation behind this project for me was to examine, understand and work with software frameworks and methodologies that would be commonly used in industry, and to develop a software application from them. The module, Distributed Systems, touched on some of the tools and technologies, Netbeans and EJB respectively, used in relation to Java Enterprise development, and this formed the foundation of my interest in the area. I felt the FYP was a perfect vehicle to supplement my knowledge of this subject, with particular attention being paid to popular and in demand technologies.

Chapter 2

Background

2.1 Technologies

There are a number of components needs to build the architecture of a web application. The nature of these components is explored below, and their contribution to the creation of a web application is analysed.

2.1.1 Web Application Framework

The WAF chosen for this project is Spring MVC [Model View Controller]. Shan and Hua defined a WAF as a defined support structure in which other software applications can be organized and developed. (Shan and Hua 2006). Model-View-Controller is a software pattern that facilitates the use of a user interface. The Model manages the behaviour and data of the application. The View will manage the information obtained from the model and display it to the user. The Controller takes user input, such as key strokes, mouse movements or a touch display, and can interact and invoke functionality within the Model and/or View.

```
@RequestMapping("/contactus")
public String contactUs(Model model){
    model.addAttribute("admins", userService.getAdmins());
    model.addAttribute("committee", userService.getCommittee());
    return "contactus";
}
```

Chapter 4

Design

4.1 Key Features

4.1.1 Users

Spring handles security a number of ways. Firstly, it uses an *authority* hierarchy to separate different levels of users. For this web application, there were three main levels of authority, with one level containing three different branches.

Roles

- **ROLE ADMIN**
 - This refers to the main administration group. The group retains full rights across the web application
- **ROLE COMMITTEE**
 - This refers to the committee, as defined by the club themselves. This group with have the ability to perform some administrator privileges, but only those directly related to club activities, not site activities.
- **ROLE MEMBER**
 - The default user state. This group can perform actions such as booking slots in a timetable, registering for a tournament, and will have access to parts of the site unavailable to non-registered users.
- **ROLE WARNING**
 - A restriction placed upon a member. For example, a member who books time slots, but does not attend.
- **ROLE SUSPEND**
 - A further restriction placed upon a member.

Chapter 5

Implementation and Testing

5.1 Introduction

This chapters focuses on the implementation of the application, with the focus on the application entities, and how they were configured.

5.2 Application Entities

5.2.1 Users - Persistence

The *User* class represents every user account within the application. (Link to appendice showing class attributes). This section will focus on a regular user, how it is configured within the application in terms of bean definition and persistence.

Firstly, as show in line one of Figure 5.1, the class needs to be configured as a *Component* for the application. This ensures that the Spring framework considers the User class as one for auto-detection, as the use of class path scanning and annotations prevalent within this application. The framework instantiates this bean, or object, automatically, without the developer having to use the *new* keyword.

```

1  @Component
2  @Entity
3  @Table(name="users")
4  public class User {
5      @Id
6      @GeneratedValue
7      int id;
8
9      @NotNull(groups={PersistenceValidationGroup.class,
10         FormValidationGroup.class})
11      @Pattern(regexp=".+\\@.+\\.+.+", message="This does not appear to be a valid
12         email address", groups={PersistenceValidationGroup.class,
13         FormValidationGroup.class})
14      @Column(name="username")
15      String username;
16
17      @Size(min=5, max=45, message="Named must be between 5 and 45
18         characters", groups={PersistenceValidationGroup.class,
19         FormValidationGroup.class})
20      @Column(name="name")
21      String name;
22
23      @Column(name="password")
24      @Size(min=5, max=15, message="Password must be between 5 and 15
25         characters", groups=FormValidationGroup.class)
26      String password;
27
28      @Column(name="gender")
29      String gender;
30
31      @Pattern(regexp="08[35679]([0-9]{7})", message="Number must be in the
32         format 083, 085, 086, 087, 089 and 7 additional numbers eg 0851234567",
33         groups={PersistenceValidationGroup.class, FormValidationGroup.class})
34      @Column(name="contact_num")
35      String contact_num;
36      //Class truncated. Some repetitive attributes omitted
37      //Getters and Setters below here.

```

Table 5.1: User Class Definition and Configuration

The *Entity* and *Table* annotations that belong to the `javax.persistence` package. These annotations are used by Hibernate in order to manage and persist the class. The *@Table*

annotation has a 'name' attribute that refers to the schema table the class maps to. There are two ways that an attribute can be assigned to a table column by Hibernate. Both methods are shown in Figure 5.1. An annotation may be placed on the attribute in order to specify a column name. Line 12 in Figure 5.1 shows the username attribute being mapped to the username column within the User database schema. The other way of specifying where an attribute should be persisted is to ensure that the attribute name matches the column name within the table. This implicitly allows Hibernate to map a class, without having to explicitly define the mapping for the persistence framework.

The User class has a number of attribute constraints placed upon it. There are two types of constraints within this application: *FormValidationGroup* and *PersistenceValidationGroup*. These are interface classes with no attributes that just serve as identifiers. As shown in lines 10, 14, 19 and 25 of Figure 5.1, an attribute may be constrained by one or more groups. An annotation, from the javax.validation.constraints, is applied to the attribute. The annotations used within this application were as detailed in Table 5.2.

| Constraint Name | Description |
|-----------------|---|
| Pattern | Ensures the value within the attribute conforms to a defined regular expression |
| Min | Ensures the value within the attribute has a minimum length |
| Max | Ensures the value within the attribute has a maximum length |
| NotNull | Ensures the value within the attribute does not have a null value |

Table 5.2: Class Constraints

5.2.2 Timetable - Persistence Changes

5.2.3 Tournaments and Events

5.2.4 Administration - Security and Session Management

The *Administration* section of the application deals with the implementation, and configuration, of the security and session management aspects of the application. A administrator has the same structure as a *User* and is defined by the *Role* it has, as seen previously in Figure 4.1.1.

5.3 Model View Controller

5.3.1 Controller Layer

5.3.2 View Layer

Apache Tiles Configuration and Implementation

Apache Tiles is configured within the web application core XML file. There are two classes that the configuration is concerned with: TilesViewResolver and TilesConfigurer. Both are declared as beans within the configuration file and automatically created when the application is launched. The TilesConfigurer object, see Figure 5.3, takes one parameter: a location of the template that the default tile, and its subsequent children, will use.

```
1 <bean id="tilesViewResolver"
2     class="org.springframework.web.servlet.view.tiles2.TilesViewResolver">
3 </bean>
4
5 <bean id="tilesConfig"
6     class="org.springframework.web.servlet.view.tiles2.TilesConfigurer">
7     <property name="definitions">
8     <list>
9         <value>/WEB-INF/layout/default.xml</value>
10    </list>
11    </property>
12 </bean>
```

Table 5.3: Apache Tiles Configuration

The default tile consists of a number of sections identified by a specific tag. These tags correspond to values within the tile layout configuration file. Using a version of inheritance, these can be overwritten and replaced with other pages in order to change the content of a page, while maintaining cohesion across the design of the application.

The following examples shows the implementation within the configuration file. The first section of code is the overall template. This specifies the default values that make up a JSP page within the application. The second segment of code is the the definition for the initial home page for the web application. By the inclusion of the *extends="users.base"* within the definition tags, it is defining the index as a sub class of the users.base definition. Consequently, it is possible to override any of the attributes within the users.base definition. In this example, the title and content of the default page are being overridden with different

values in order construct a more suitable page. The header, links and footer however remain the same, and will do so will all pages following this format, as shown in Figure 5.4.

```

1 <definition name="users.base" template="/WEB-INF/templates/default.jsp">
2     <put-attribute name="title" value="Monaleen Tennis Club - Default
      Template"></put-attribute>
3     <put-attribute name="header"
      value="/WEB-INF/tiles/header.jsp"></put-attribute>
4     <put-attribute name="links"
      value="/WEB-INF/tiles/links.jsp"></put-attribute>
5     <put-attribute name="content"
      value="/WEB-INF/tiles/content.jsp"></put-attribute>
6     <put-attribute name="footer"
      value="/WEB-INF/tiles/footer.jsp"></put-attribute>
7 </definition>
8
9 <definition name="index" extends="users.base">
10     <put-attribute name="title" value="Monaleen Tennis Club - Home
      Page"></put-attribute>
11     <put-attribute name="content"
      value="/WEB-INF/tiles/index.jsp"></put-attribute>
12 </definition>
13
14 <definition name="admin" extends="users.base">
15     <put-attribute name="title" value="Monaleen Tennis Club -
      Admin"></put-attribute>
16     <put-attribute name="content"
      value="/WEB-INF/tiles/admin.jsp"></put-attribute>
17 </definition>

```

Table 5.4: Apache Tiles Configuration

JSTL

JSTL is used within the application to manage how information was displayed. It was preferred, during the development of the application, that all of the logic be handled at the Controller level, and that the JSP pages would resolve the models passed to it into the view seen by the user. It was not desirable for the pages to contain JSP directives, or to use the implicit objects contained within JSP pages.

The main tags used within the application were the JSTL Core tags. These tags allow the usage of conditional statements and the definition of parameters within the JSP page. In

order to use this technology, the relevant jar must be made available in the build path or within the Maven dependencies of the project. The following statement must be included in all JSP pages that wish to make use of the tags also.

```
1 <%@ taglib prefix="c" uri="http://java.sun.com/jsp/jstl/core"%>
```

Within the application, the controller will create a model and pass it to the JSP page. The page uses the JSTL tags to manage and display relevant information from the model, and user actions based on the information contained within. The example below is taken from the Timetable display page from the application.

| Model Name | Summary |
|------------|---|
| name | The username of the currently authenticated user |
| realName | The real name of the currently authenticated user |
| bookings | The number of remaining bookings of the currently authenticated users |
| date | The current week of the year and the current date. Calculated using separate method. |
| next | The id number of the court following the current court, if applicable |
| prev | The id number of the court preceding the current court, if applicable |
| court | The current court, determined by the current week, provided by the java.util.Date class |

Table 5.5: Model Attributes

```

1 @RequestMapping(value = "/gotoCourt", method = RequestMethod.POST)
2 public String chooseCourt(Model model, HttpServletRequest request) {
3     //abbreviated method to display court, logic removed
4     //highlighting the attributes within the model
5     model = addDateToTimetable(model, id);
6     model.addAttribute("series", timetableService.getById(id).getSeries());
7     model.addAttribute("name",
8         SecurityContextHolder.getContext().getAuthentication().getName());
9     model.addAttribute("court", current);
10    model.addAttribute("realname", name);
11    model.addAttribute("bookings", left);
12    if (seriesMatch(courtID, nextCourt)) {
13        model.addAttribute("next", (current.getId() + 1));
14    }
15    if (seriesMatch(courtID, prevCourt)) {
16        model.addAttribute("prev", (current.getId() - 1));
17    }
18    return "court";
19 }

```

This example is an excerpt from the TimetableContoller class. The logic determining the values has been removed. This is to highlight how attributes are added to the model from within the controller. This is the information that the JSP page will have access to once it has been displayed.

The above code deals with the display of *Monday* within the Timetable display page. In the *c:forEach* tags, it loops through each value in the *court.monday* list that has been passed to it by the controller. The size of this list is determined by the user when the timetable is created, and the number of slots per day is specified. If the current value being examined in the loop is equal to the value "Free Court", it will display a link to the Book Form mapping. This aspect of the Timetable Controller will check that a user has any remaining bookings left and respond as appropriate. In the event that the value in the list does not equal "Free Court", it will make a choice. If the currently authenticated user made the booking, it will display an option to remove their booking from the slot. Otherwise, it will give any other user an option to report the user as a "no show" should a user fail to show for a previously booked slot.

```

1 <c:forEach var="row" varStatus="loop" items="{court.monday}">
2 <c:choose>
3 <c:when test="{row eq 'Free Court'}"><tr>
4 <td class="inner"><form action="{pageContext.request.contextPath}/bookCourt"
5 method="POST">
6 <input type="hidden" value="{loop.index}" name="position" />
7 <input type="hidden" value="monday" name="day" />
8 <input type="hidden" value="{court.id}" name="ttid" />
9 <input type="submit" value="Book">
10 </form></td></tr>
11 </c:when>
12 <c:otherwise><tr><td class="inner">{row}
13 <c:choose>
14 <c:when test="{name eq pageContext['request'].userPrincipal.name && row eq
    realname }">
15 <form action="{pageContext.request.contextPath}/unbookCourt" method="POST">
16 <input type="hidden" value="{loop.index}" name="position" />
17 <input type="hidden" value="monday" name="day" />
18 <input type="hidden" value="{court.id}" name="ttid" />
19 <input type="submit" value="Unbook">
20 </form></c:when>
21 <c:otherwise>
22 <form action="{pageContext.request.contextPath}/reportNoShow" method="POST">
23 <input type="hidden" value="{row}" name="bookedUser" />
24 <input type="hidden" value="monday" name="day" />
25 <input type="hidden" value="{court.id}" name="ttid" />
26 <input type="submit" value="Report User">
27 </form></c:otherwise>

```

Table 5.6: Code Showing Display of Timetable

5.4 Logging the Application

The logging for this application was provided by *log4j*. Logging became very useful for tracking down, and isolating bugs, throughout the application. Since there were a considerable number of dependencies and different technologies working together, it rapidly became very difficult to see where errors originated from. Stack-traces quickly became unmanageable. *Log4j* works by allowing the developer to view a number of logs of varying types within the application.

| Log Type | Description |
|----------|---|
| INFO | Messages that highlight the progress of the application at coarse-grained level |
| DEBUG | Fine-grained informational events that are most useful to debug an application |
| TRACE | Finer-grained informational events than the DEBUG |
| WARN | Potentially harmful situations |
| ERROR | Error events that might still allow the application to continue running |
| FATAL | Very severe error events that will presumably lead the application to abort |

Table 5.7: Log Types

Log4j is configured with a properties file that allows you to see the various levels of logs displays by the applications running. Implementation of a logging system resolved a number of Spring Security issues within the web application. Spring Security, concerned with access rights to mappings within the application, did not output failed access attempts to the console. This made it very difficult to debug. When configuring *Log4j* to catch the logs created by the security components, the application became much easier to debug. The properties file for this web application is detailed below.

```

1 log4j.rootLogger=INFO, CONSOLE
2 log4j.appender.CONSOLE=org.apache.log4j.ConsoleAppender
3 log4j.appender.CONSOLE.layout=org.apache.log4j.SimpleLayout
4 log4j.logger.org.hibernate.SQL=DEBUG
5 log4j.logger.org.hibernate.type=TRACE
6 log4j.logger.org.springframework.security=DEBUG

```

Table 5.8: Log4j Configuration

Logging can be implemented on a class by class basis. Within this application, it was used to display informational messages to the developer. These included items such as database access, objects being created and updated. In order to enable logging on a class, a logger must be instantiated with reference to the class that requires logging. The logger object then is called with a method corresponding to the type of log you wish to throw along with a message.

```

1 private static Logger logger = Logger.getLogger(UserDAO.class);
2
3 public Session session(){
4     logger.info("Session Factory returning current session....");
5     return sessionFactory.getCurrentSession();
6 }
7
8 public List<User> getUsers() {
9     logger.info("Selecting All Enabled Members....");
10    return session().createQuery("from User where enabled = '1'").list();
11 }
12
13 public User getUserByName(String name) {
14     Criteria crit = session().createCriteria(User.class);
15     crit.add(Restrictions.eq("name", name));
16     try{
17         User user = (User) crit.uniqueResult();
18     }
19     catch(Exception e){
20         logger.error{"Must be unique result : Thrown from
21                     UserDAO.getUserByName(String name)};
22     }
23     return user;
24 }

```

Table 5.9: Logger Usage within UserDAO.class

5.5 Configuration of the Application

In order to begin implementation with the Spring MVC framework, there are a number of configuration files that are necessary. The core file is the *web.xml* file. This file is responsible for the configuration for the framework. One of the key responsibilities is the definition of the context xml files, whose purpose will be elaborated on later. Different development profiles can be configured within this file in order to produce different development environments, such as production and testing environments. The configuration of this file within the application is shown in Figure 5.10

```

1 <property name="hibernateProperties">
2 <props>
3 <prop key="hibernate.dialect">org.hibernate.dialect.MySQL5Dialect</prop>
4 </props>
5 </property>

```

Table 5.11: Hibernate Configuration

```

1 <context-param>
2 <param-name>contextConfigLocation</param-name>
3 <param-value>
4     classpath:beans/dao-context.xml
5     classpath:beans/service-context.xml
6     classpath:beans/security-context.xml
7 </param-value>
8 </context-param>

```

Table 5.10: Spring Configuration

Of particular importance are the definition of the context parameters. In this project, there were three main context files.

- Data Access Object Context
- Service Context
- Security Context

The DAO Context file specifies the packages that contain the various DAO classes within the application. It also contains configurations for both the database connection details, and Hibernate configurations. Packages containing entity classes for Hibernate are specified within this context also.

The Service Context file is responsible for specifying the base package containing the Service classes necessary to facilitate the collaboration between the Controller classes and the DAO classes. This file specifies that annotations will be used to configure the Service classes.

```

1 <context:annotation-config></context:annotation-config>
2 <context:component-scan base-package="service"></context:component-scan>

```

The Security Context file is the larger of the three files, and is responsible for the security configuration of the web application. There are four main areas within the file that were used to configure the web application created in this project.

The User Service aspect of the configuration file is responsible for retrieving users and their authority within the scope of the web application.

The URL access configuration ensures that only users who are authorised to access certain portions of the site are allowed access.

The Security Annotations allow the creation of an extra level of security into an application. At class level, annotations can be placed on methods to further ensure that proper access is enforced throughout the application.

Lastly, the Security Context is responsible for creating the password encoder bean in which passwords are encoded, and decoded, upon account creation and login. This ensures that no passwords in plain text form are ever stored on either the server or the database within the web application

- User Service

```
1 <security:authentication-manager>
2     <security:authentication-provider>
3         <security:jdbc-user-service data-source-ref="dataSource"
4             id="jdbcUserService" authorities-by-username-query="select
5                 username, authority from users where binary username = ?" />
6     <security:password-encoder
7         ref="passwordEncoder"></security:password-encoder>
8 </security:authentication-provider>
9 </security:authentication-manager>
```

- URL Access

```
1 <security:intercept-url pattern="/timetable" access="permitAll"/>
2 <security:intercept-url pattern="/reportNoShow" access="permitAll"/>
3 <security:intercept-url pattern="/admin" access="hasRole('ROLE_ADMIN')"/>
4 <security:intercept-url pattern="/approveMembers"
5     access="hasRole('ROLE_ADMIN')"/>
```

- Security Annotation for Service Class

```
1 <security:global-method-security
2     secured-annotations="enabled"></security:global-method-security>
3 //Java Code from TimetableService class.
4 //This code is invoked when booking a slot on the timetable and is only
5     accessible by registered members.
6 @Secured({"ROLE_ADMIN", "ROLE_MEMBER", "ROLE_COMMITTEE", "ROLE_WARNING",
7     "ROLE_SUSPEND"})
8     public void update(Timetable t){
9         timetableDAO.updateTimetable(t);
10    }
```

- Password Encoding

```
1 <bean id="passwordEncoder"
2     class="org.springframework.security.crypto.password.StandardPasswordEncoder">
3 </bean>
```

5.6 Test Driven Development

The primary method of testing was implemented using JUnit. A Test Suite of JUnit tests were prepared to test the key features of the application. A separate test database was constructed. It was important to ensure that the testing environment was using the same context files as the production environment. The test class had to be annotated to enforce this. While the context files were the same, the DataSource file has changed as a different database is being using in this environment.

```
1 @ActiveProfiles("dev")
2 @ContextConfiguration(locations = { "file:src/main/java/beans/dao-context.xml",
3   "file:src/main/java/beans/security-context.xml",
4   "classpath:test/config/datasource.xml" })
5 @RunWith(SpringJUnit4ClassRunner.class)
6 public class HibernateTests {
7
8     @Autowired
9     private UserDao userDao;
10
11     @Autowired
12     private TournamentDAO tournamentDAO;
13
14     @Autowired
15     private DataSource dataSource;
16
17     //Class truncated
18 }
```

Table 5.12: JUnit Test Example

The database is then initialised to ensure the tests are being run against the same database, and that repeat tests are consistent.

```
1 @Before
2 public void init(){
3     JdbcTemplate jdbc = new JdbcTemplate(dataSource);
4     jdbc.execute("delete from users");
5 }
```

Table 5.13: JUnit @Before Test Configuration

In these example tests, the UserDao is being tested to ensure that it returns true when

the `exists()` method is called on it. This is important within the scope of the application to ensure that primary keys are not duplicated. The method is annotated with `@Test`. The methods `assertTrue` and `assertFalse` expect a return value of true and false respectively. They take two parameters: an error message and a boolean value, or a method that returns a boolean value. In the `assertTrue` method below, the `UserDAO` will return true if the user exists. In the event that the user does not exist, it will fail the test and return the message "User should exist".

```
1 @Test
2 public void testExists(){
3     userDao.createUser(user1);
4     assertTrue("User should exist", userDao.exists(user1.getUsername()));
5     assertFalse("User should not exist",
6         userDao.exists("jkljfsakfjahghdsopjclkhfkjafhkjdshFHajhgouwe"));
7 }
```

Table 5.14: JUnit UserDAO Exists() Test

Another test with the `UserDAO` was to ensure that users were being saved correctly. In this example, users are being created and saved to the database. The method `assertEquals` checks two integer values and returns an error message if they do not match.

```
1 @Test
2 public void testCreateRetrieve(){
3     userDao.createUser(user1);
4     List<User> users1 = userDao.getAllUsers();
5     assertEquals("One user should have been created and retrieved", 1,
6         users1.size());
7     assertEquals("Inserted user should match retrieved", user1, users1.get(0));
8     userDao.createUser(user2);
9     userDao.createUser(user3);
10    userDao.createUser(user4);
11    List<User> users2 = userDao.getAllUsers();
12    assertEquals("Number of users should be four", 4, users2.size());
13 }
```

Table 5.15: JUnit Create and Size Test

5.7 Conclusion

Chapter 6

Software Quality

6.1 Application Summary

The following is a summary of the various metrics of the application. A detailed breakdown by package is contained within the appendices.

| Metric | Total | Mean | Std. Deviation | Maximum |
|------------------------------|-------|-------|----------------|---------|
| McCabe Cyclomatic Complexity | n/a | 1.262 | .862 | 8 |

Appendix A

Appendices

A.1 Application Breakdown

The following section is a breakdown of the application into its various packages and files.

A.1.1 Java Source

Package: beans

| File Name | File Type | Function | No. Lines |
|----------------------|-----------|--|--------------|
| beans.xml | XML | Context Component Scan, Datasource Definition | 0 |
| dao-context.xml | XML | Hibernate Configuration, Database Exception Translator | 0 |
| security-context.xml | XML | Security Configuration, Access Control | 0 |
| service.xml | XML | Service Configuration | 0 |

Table A.1: beans package

Package: controllers

| File Name | File Type | Function | No. Lines |
|----------------------|-----------|--|--------------|
| ErrorHandler | JAVA | Handles application errors | |
| EventController | JAVA | Handles Event actions | |
| HomeController | JAVA | Displays Home Page | |
| LoginController | JAVA | Manages user login | |
| MembersController | JAVA | Handles Member actions | |
| NewsController | JAVA | Handles display and creation of News | |
| SiteController | JAVA | Displays site pages with static data | |
| TimetableController | JAVA | Controls the Timetable Creation and Display | |
| TournamentController | JAVA | Handles Creation and Management of Tournaments | |

Table A.2: controllers package

Package: dao

| File Name | File Type | Function | No. Lines |
|---------------|-----------|---|--------------|
| EventDAO | JAVA | DAO for IEvent | |
| LogDAO | JAVA | DAO for ILog | |
| NewsDAO | JAVA | DAO for News | |
| RoleDAO | JAVA | DAO for Role | |
| TimetableDAO | JAVA | DAO for Timetable | |
| TournamentDAO | JAVA | DAO for Tournament | |
| UserDAO | JAVA | DAO for User | |
| UserRowMapper | JAVA | JDBC Row Mapper to handle multiple User objects | |

Table A.3: dao package

Package: email

| File Name | File Type | Function | No. Lines |
|-----------|-----------|-------------------------------|--------------|
| Email | JAVA | Create and Send Email Message | |
| IEmail | JAVA | Interface for Email class | |

Table A.4: email package

Package: events

| File Name | File Type | Function | No. Lines |
|-----------|-----------|--|--------------|
| Event | JAVA | Defines an event used by the Timetable | |
| IEvent | JAVA | Interface for Event class | |

Table A.5: event package

Package: events.tournaments

| File Name | File Type | Function | No. Lines |
|------------|-----------|------------------------------|--------------|
| Tournament | JAVA | Defines an Tournament object | |

Table A.6: events.tournament package

Package: logs

| File Name | File Type | Function | No. Lines |
|-----------|-----------|--|--------------|
| Log | JAVA | Defines the structure of a system log file | |
| ILog | JAVA | Interface for Log class | |

Table A.7: log package

Package: news

| File Name | File Type | Function | No. Lines |
|-----------|-----------|--|--------------|
| News | JAVA | Defines the structure of a News object | |

Table A.8: news package

Package: properties

| File Name | File Type | Function | No. Lines |
|-----------|------------|--|--------------|
| jdbc | PROPERTIES | Holds log in values for the JDBC connection | |
| mail | PROPERTIES | Holds the log in values for the email system | |

Table A.9: properties package

Package: reports

| File Name | File Type | Function | No. Lines |
|------------|------------|----------------------------------|--------------|
| IRreport | PROPERTIES | Interface for Reports | |
| CSVCreator | PROPERTIES | Creates a CSV file for User Data | |

Table A.10: reports package

Package: service

| File Name | File Type | Function | No. Lines |
|-------------------|-----------|--|--------------|
| EventService | JAVA | Layer between EventController and EventDAO | |
| LogService | JAVA | Layer between Controllers and LogDAO | |
| NewsService | JAVA | Layer between NewsController and NewsDAO | |
| RoleService | JAVA | Layer between Controllers and RoleDAO | |
| TimetableService | JAVA | Layer between TimetableController and TimetableDAO | |
| TournamentService | JAVA | Layer between TournamentController and TournamentDAO | |
| UserService | JAVA | Layer between MemberController and UserDAO | |

Table A.11: service package

Package: timetable

| File Name | File Type | Function | No. Lines |
|--------------|-----------|---|--------------|
| Timetable | JAVA | Interface for Timetable | |
| MonaleenTTV1 | JAVA | Defines structure and behaviour of Timetable object | |

Table A.12: timetable package

Package: users

| File Name | File Type | Function | No. Lines |
|----------------------------|-----------|--|--------------|
| FormValidationGroup | JAVA | Form Validation Class | |
| PersistenceValidationGroup | JAVA | Hibernate Validation Class | |
| Grade | JAVA | Defines structure of a Grade object. Used in User class. | |
| User | JAVA | Defines structure of a User object | |
| Role | JAVA | Defines structure of Role object, and its attributes | |

Table A.13: reports package

A.2 Apache Struts and JSP Pages

layout

| File Name | File Type | Function | No. Lines |
|-----------|-----------|--|--------------|
| default | XML | Defines the structure for each JSP page in the application | |

Table A.14: struts layout

templates

| File Name | File Type | Function | No. Lines |
|-----------|-----------|--|--------------|
| default | JSP | The default JSP page that is used as the template for all others | |

Table A.15: templates layout

tiles

| File Name | File Type | Function | No. Lines |
|------------------|-----------|---|-----------|
| accessdenied | JSP | Access Denied page | |
| admin | JSP | Displays administrator page with admin options | |
| adminAnalysis | JSP | Displays site analytics | |
| adminEditProfile | JSP | Allows admin to edit user accounts | |
| alreadyReg | JSP | Error page when attempting to re-register for tournament | |
| approveMembers | JSP | Admin approve members page | |
| blockMembers | JSP | Admin suspend members page | |
| bookingExists | JSP | Error page to handle duplicate bookings | |
| checkRegistered | JSP | Displays users registered for a selected tournament | |
| chooseEdit | JSP | Choice for which Timetable to edit | |
| confirmEdit | JSP | Detailed layout for editing individual slots in Timetable | |
| contactus | JSP | Contact Us page for application | |
| content | JSP | Place-holder page for default JSP template | |
| court | JSP | Displays selected Timetable and available options | |
| createEvent | JSP | Admin Create Event page | |
| createmembers | JSP | User Registration page | |
| createNewRole | JSP | Admin create new User Role | |
| createNews | JSP | Admin Create News page | |
| createTimetable | JSP | Admin Create Timetable page | |
| createTournament | JSP | Admin Create Tournament page | |
| deleteNews | JSP | Admin Delete News entry | |
| deleteTimetable | JSP | Admin Delete Timetable object | |
| deleteTournament | JSP | Admin Delete Tournament object | |
| displayUsers | JSP | Admin Displays all users to choose which one to edit | |
| editDetails | JSP | User Edit Profile | |
| emailSent | JSP | Email Sent Confirmation Page | |
| error | JSP | Default Error Page. Displays Class Error. | |
| fillTimetable | JSP | Page that allows admin to create Timetable template for series. | |

| File Name | File Type | Function | No. Lines |
|-------------------|-----------|--|-----------|
| index | JSP | Default Home page | 0 |
| footer | JSP | Place-holder page for default JSP template | |
| header | JSP | Place-holder page for default JSP template | |
| links | JSP | Displays Site Navigation links | |
| loggedout | JSP | Logout Confirmation page | |
| login | JSP | Login Page - Linked to Spring Security | |
| maps | JSP | Displays Google Maps Location for Club | |
| members | JSP | Displays Members Address Book for authenticated users | |
| membership | JSP | Displays Membership Information | |
| news | JSP | Displays News Page | |
| profile | JSP | Displays User Profile | |
| profileUpdated | JSP | Confirmation of profile being updated | |
| registerSuccess | JSP | Confirmation that user has successfully registered | |
| resetAllTimetable | JSP | Removes all bookings for a Timetable | |
| seriesChoice | JSP | Choose which Timetable series to edit/reset | |
| timetable | JSP | Displays enabled timetables for users | |
| timetableStatus | JSP | Allows admin to enable or disable timetables | |
| tournaments | JSP | Displays Enabled Tournaments for Users | |
| tournamentStatus | JSP | Allows admin to enable/disable/activate/deactivate tournaments | |
| tournamentSuccess | JSP | Displays success upon successful tournament creation | |
| viewAllMembers | JSP | Admin View of Members | |
| viewEvents | JSP | Admin Event Management | |

Table A.16: templates layout
